

Amateur Radio is being threatened by BPL technology. The Current BPL technology will destroy my use of radio spectrum licensed for my use by the FCC. This technology will be broadcasting broadband data on powerlines all over the US on frequencies from 2 - 80Mhz. The thousands of miles of power lines will act as antennas radiating these signals all over the country. This will cause several S-units of noise on amateure bands from 180-6 meters. It will also adversely effect other lisenced users (private, commercial, and government) within that spectrum. I urge you to reconsider implementation of this technology as it will render useless much of the spectrum the FCC has already set up laws to protect.

Sincerely,  
Jeffrey Johnson KD5QJF,
